Name: Solution

Math 54, Spring 2009, Section 109 Quiz 1

(1) Find the general solution:

$$x - 4y + 2z = 3$$

$$2y + 6z = -8$$

$$-2x + 10y + 2z = -14$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 2 & 6 - 8 \\ -2 & 10 & 2 & -14 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 2 & 6 - 8 \\ 0 & 2 & 6 - 9 \end{bmatrix} \xrightarrow{-R_2 + R_3 - 3R_3}$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 2 & 6 - 8 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{\frac{1}{2}R_2 - 3R_2} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 2 & 6 - 9 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{R_3} \begin{bmatrix} 1 - 4 & 2 & 3 \\ 0 & 1 & 3 - 4 \\ 0 & 0 & 0 \end{bmatrix}$$

(2) (a) State the definition of a set $\{\vec{v}_1,\ldots,\vec{v}_p\}$ being linearly dependent. The sot is called linearly dependent if there exist $SGalasS \times_{1,\ldots} \times_p ER$ such that $\times,\vec{V},+\ldots+\times_p\vec{V}_p=\vec{o}$, and not all the \times 5 are O.

(b) Can you have a set of two linearly dependent vectors in \mathbb{R}^4 ? Give an example, or say why it is not possible.

Yes.
$$\left\{ \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 2 \\ 2 \\ 2 \end{bmatrix} \right\}$$

(3) For which values of h does the following vector equation have one solution? No solutions? Many solutions?

$$x_1 \begin{bmatrix} 1 \\ 3 \\ 1 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ -1 \\ -2 \end{bmatrix} + x_3 \begin{bmatrix} 2 \\ 3 \\ -4 \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ h \end{bmatrix}.$$

Equivort to [102 1] 's system of equations.

$$\begin{bmatrix} 1 & 0 & 2 & 1 \\ 0 & -1 & -3 & -1 \\ 0 & -2 & -6 & h - 1 \end{bmatrix} \longrightarrow \begin{bmatrix} 1 & 0 & 2 & 1 \\ 0 & 1 & 3 & 1 \\ 0 & -2 & -6 & h - 1 \end{bmatrix} \longrightarrow$$

If h=-1, the system is consistent.

Since three is a free variable (x3) in

this case there are infinitely many soldiers. If ht-1, then are no solution. There is Mever just one solution.
